# CUSTOMER Review Report

## Faculty Name: Priyanka Bharti ma'am

### INPUTS FROM CUSTOMER

#### 1. Frequency of Course Structure Updates

Course structures are typically updated once per academic year or whenever there are significant changes in industry or market requirements. Updates are made subject-wise and depend on the nature of the course, whether it is coding-oriented or theory-based.

#### 2. Responsibility for CO-PO Mapping

The CO-PO mapping process is carried out collaboratively by a team comprising university faculty, industry experts, and members of the Board of Studies. The final structure is further reviewed and scrutinized by alumni.

#### 3. Time Required to Design a Course Structure

If the course structure is developed from scratch without any previous reference material, it requires a minimum of 20 days, assuming approximately 2 hours of work per day. If only updates, refinements, or minor changes are required, the process can be completed within a week.

#### 4. Engagement Hours for a 3-Credit Subject

A 3-credit subject involves approximately 35–40 hours of engagement per faculty.

#### 5. Tools Used by Professors

Professors utilize a combination of previous years' materials, expert advice, and inputs from industry experts. The process is largely manual and may vary depending on the individual faculty member.

### PAIN POINTS

The course content must be industry-relevant and aligned with university standards. A key concern is ensuring the accuracy and authenticity of the material obtained.

### FEEDBACK

It is important to clearly identify the semester or course for which the project is being designed. Additionally, understanding the target audience and intended users is essential for effective implementation.

### CONCLUSION

Course design and updating is a labor-intensive process that requires a significant amount of effort from all professionals involved in the process. The challenges associated with the process, such as manpower involved in the process, complexity in CO-PO mapping, and issues associated with accuracy,  prove the need for a model that can simplify the process for all involved in the process.
